

First Layer Check

A quick preflight and observation sheet for a routine FDM print.

Follow your printer and material manufacturer's instructions first.

This sheet helps you record observations; it is not an equipment guide or guaranteed fix.

Before pressing Print

- ☐ Build surface is clean and appropriate for the material.
- ☐ Filament type and slicer profile match the spool and print.
- ☐ Nozzle and bed temperatures follow the material maker's starting guidance.
- ☐ Bed leveling or mesh routine is complete, if your printer requires it.
- ☐ First-layer speed and height are intentionally set in the slicer.

Observe the first layer

- ☐ Lines appear continuous and attach to the surface.
- ☐ Adjacent lines meet without severe gaps or excessive ridges.
- ☐ Corners stay attached; no nozzle scraping or loose material is visible.

Record one useful adjustment
